# Amplite ${ }^{\text {TM }}$ Fluorimetric Coenzyme A Quantitation Kit *Green Fluorescence* 

Catalog number: 15270

| Component | Storage | Amount |
| :--- | :--- | :--- |
| Component A: CoA Green ${ }^{\text {TM }}$ | Freeze $\left(<-15^{\circ} \mathrm{C}\right)$, Minimize light exposure | 1 vial |
| Component B: Assay Buffer | Freeze $\left(<-15^{\circ} \mathrm{C}\right)$ | 1 bottle $(25 \mathrm{~mL})$ |
| Component C: Coenzyme A (CoA) Standard (FW=767.53) | Freeze $\left(<-15^{\circ} \mathrm{C}\right)$, Minimize light exposure | 1 vial $(154 \mu \mathrm{~g})$ |
| Component D: DMSO | Freeze $\left(<-15^{\circ} \mathrm{C}\right)$ | 1 vial $(200 \mu \mathrm{~L})$ |

## OVERVIEW

Coenzyme A (CoA) is a universal and essential cofactor in all forms of cellular life acting as a principal acyl carrier in numerous biosynthetic, energy-yielding, and degradative pathways. It plays important roles in the synthesis and oxidation of fatty acids, pyruvate oxidation and the citric acid cycle. Measurement of CoA is one of the essential tasks for investigating biological processes and events in many biological systems. There are a few reagents or assay kits available for quantitating CoA content in biological systems. However, the existing commercial kits either lack sensitivity or have tedious procedures. Our Amplite ${ }^{T M}$ Fluorimetric CoA Qutitation Assay Kit provides an ultrasensitive fluorimetric assay to quantitate CoA content by detection of -SH group in CoA. Our proprietary fluorogenic CoA Green ${ }^{\text {TM }}$ dye used in the kit becomes strongly fluorescent upon reacting with -SH. The assay kit can detect as little as 4 picomole of CoA in a $100 \mu \mathrm{~L}$ assay volume ( 40 nM ). It can be performed in a convenient 96 -well or 384 -well microtiter-plate format and easily adapted to automation without a separation step.

## AT A GLANCE

## Protocol summary

1. Prepare CoA working solution ( $50 \mu \mathrm{~L}$ )
2. Add CoA standards or test samples ( $50 \mu \mathrm{~L}$ )
3. Incubate at RT for 10 minutes - 1 hour
4. Monitor the fluorescence increase at $E x / E m=490 / 520 \mathrm{~nm}$

Important Thaw all the kit components at room temperature before starting the experiment.

## KEY PARAMETERS

| Instrument: | Fluorescence microplate reader |
| :--- | :--- |
| Excitation: | 490 nm |
| Emission: | 520 nm |
| Recommended plate: | Solid black |

## PREPARATION OF STOCK SOLUTIONS

Unless otherwise noted, all unused stock solutions should be divided into single-use aliquots and stored at -20 ${ }^{\circ} \mathrm{C}$ after preparation. Avoid repeated freeze-thaw cycles.

1. CoA standard solution ( 1 mM ):

Add $200 \mu \mathrm{~L}$ of ddH $\mathrm{H}_{2} \mathrm{O}$ into the CoA standard vial (Component C) to make 1 mM (1 $\mathrm{nmol} / \mu \mathrm{L}$ ) stock solution.

Note It is highly recommended to use the $\mathrm{ddH}_{2} \mathrm{O}$ that has been sparged with nitrogen to remove oxygen for preparing coenzyme A standard solution. The aqueous solution is not stable and will degrade rapidly. It should be stored at 2-8 ${ }^{\circ} \mathrm{C}$ and used within the day.
2. CoA Green ${ }^{T M}$ stock solution (100X):

Add $100 \mu \mathrm{~L}$ of DMSO (Component D) into the vial of CoA Green ${ }^{\text {TM }}$ (Component A) to make 100X stock solution.

## PREPARATION OF STANDARD SOLUTION

## CoA standard

For convenience, use the Serial Dilution Planner: https://www.aatbio.com/tools/serial-dilution/15270

Add $30 \mu \mathrm{~L}$ of CoA standard solution to $970 \mu \mathrm{~L}$ of Assay Buffer (Component B) to generate $30 \mu \mathrm{M}(30 \mathrm{pmol} / \mu \mathrm{L}) \mathrm{CoA}$ standard. Take the $30 \mu \mathrm{M}$ CoA standard solution to perform $1: 3$ serial dilutions with Assay buffer (Component B) to get serial dilutions of CoA standard (CoA1-CoA7)

Note Diluted CoA standard solution is unstable, and should be used within 4 hours.

## PREPARATION OF WORKING SOLUTION

Add $50 \mu \mathrm{~L}$ of CoA Green ${ }^{\text {TM }}$ stock solution (100X) into 5 mL of Assay Buffer Component B) and mix well.

## SAMPLE EXPERIMENTAL PROTOCOL

Table 1. Layout of CoA standards and test samples in a solid black 96 -well microplate. CoA = Coenzyme A standard (CoA1 - CoA7, 0.01 to $10 \mu \mathrm{M}$ ); BL = blank control; TS = test sample.

| BL | BL | TS | TS |
| :---: | :---: | :---: | :---: |
| CoA1 | CoA1 | $\ldots$ | $\ldots$ |
| CoA2 | CoA2 | $\ldots$ | $\ldots$ |
| CoA3 | CoA3 |  |  |
| CoA4 | CoA4 |  |  |
| CoA5 | CoA5 |  |  |
| CoA6 | CoA6 |  |  |
| CoA7 | CoA7 |  |  |

Table 2. Reagent composition for each well

| Well | Volume | Reagent |
| :---: | :---: | :---: |
| CoA1-CoA7 | $50 \mu \mathrm{~L}$ | serial dilution (0.01 to $10 \mu \mathrm{M}$ ) |
| BL | $50 \mu \mathrm{~L}$ | Assay Buffer (Component B) |
| TS | $50 \mu \mathrm{~L}$ | sample |

1. Prepare coenzyme A standards (CoA), blank controls (BL), and test samples (TS) according ot the layout provided in Tables 1 and 2. For a 384 -well plate, use 25 $\mu \mathrm{L}$ of reagent per well instead of $50 \mu \mathrm{~L}$.
2. Add $50 \mu \mathrm{~L}$ of CoA working solution to each well of the CoA standard, blank control, and test sample to make the total CoA assay volume of $100 \mu \mathrm{~L} /$ well. For a 384 -well plate, add $25 \mu \mathrm{~L}$ of CoA working solution into each well instead,
3. Incubate the reaction at room temperature for 10 minutes to 1 hour, protected from light.
4. Monitor the fluorescence increase at $\mathrm{Ex} / \mathrm{Em}=490 / 520 \mathrm{~nm}$ with a fluorescence plate reader.

## EXAMPLE DATA ANALYSIS AND FIGURES

The reading (RFU) obtained from the blank standard well is used as a negative control. Subtract this value from the other standards' readings to obtain the baseline corrected values. Then, plot the standards' readings to obtain a standard curve and equation. This equation can be used to calculate Coenzyme A samples. We recommend using the Online Linear Regression Calculator which can be found at:
https://www.aatbio.com/tools/linear-logarithmic-semi-log-regression-onlinecalculator

Figure 1. CoA dose response was measured in a 96 -well solid black plate with Amplite ${ }^{\text {TM }}$ Fluorimetric Coenzyme A Quantitation Assay Kit using a NOVOstar microplate reader (BMG Labtech).
